The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data.

Analysis Results

Based on the provided Python script and data file, the following metrics were extracted from the 10-second (2400-frame) recording:

- **Total frames analyzed:** 1397 (approx. 5.82 seconds of data)
- **Number of taps detected:** 11
- **Rhythm (Tap Periods):** The time between taps was [159, 127, 139, 125, 145, 139, 123, 122, 119, 127] frames. The average period was 132.5 frames, with a very low standard deviation (12.01 frames), indicating a **highly regular rhythm** with 0 interruptions or hesitations.
- **Amplitude (Normalized):** The normalized amplitudes for the 11 taps were [0.98, 0.91, 0.94, 0.94, 0.86, 0.91, 0.91, 0.84, 0.93, 0.76, 1.00] .

Detailed Motivation for Score

To assign a score, I will evaluate the performance based on the MDS-UPDRS criteria: speed, rhythm (hesitations/halts), and amplitude.

1. **Speed and Rhythm:** The subject completed 11 taps in approximately 5.82 seconds. The rhythm was exceptionally consistent, as shown by the low standard deviation of the tap periods. The plot also visually confirms a regular, repeating pattern without any "hesitations" or "halts." The performance shows no "slowing."
2. **Amplitude Decrement:** This is the key criterion for scoring. The 10-tap instruction is the benchmark. Let's analyze the amplitude of the first 10 taps:
 - [0.98, 0.91, 0.94, 0.94, 0.86, 0.91, 0.91, 0.84, 0.93, 0.76]
 - The amplitudes fluctuate throughout the 10 taps. There is a noticeable drop at tap 10 (0.76), but this is followed by the highest tap of all at tap 11 (1.00), suggesting the 10th tap was just a slight misstep, not a sustained decrement or fatigue.
 - There is no clear pattern of "decrementing amplitude." The amplitude does not systematically decrease "near the end" (Score 1), "midway" (Score 2), or "after the 1st tap" (Score 3). The performance is slightly variable but does not show the progressive fatigue (decrement) that the scale is designed to detect.

Conclusion:

The subject demonstrates fast, regular tapping with no interruptions or hesitations. The amplitude is large and, despite some variability, does not show a clear, progressive decrement as described in the criteria for scores 1, 2, or 3. The performance is therefore considered normal.
