The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data, scored according to the MDS-UPDRS item 3.4 criteria.

Finger Tapping Performance Analysis

The provided Python script was adapted to analyze the `751297988_20200824_Hands_R_L.mp4FT.csv` file. The analysis calculates the normalized distance between the thumb and index finger for each frame and identifies peaks in this distance, which correspond to the "taps" (points of maximum separation).

The plot below visualizes this normalized distance over the duration of the recording. The detected taps (peaks) are marked with red 'x's.

Key Metrics from Analysis

The analysis of the 5.82-second data segment yielded the following results:

- **Number of Taps: 11 taps** were detected. This indicates the subject successfully completed the instructed 10 taps within the time frame.
 - **Amplitude (Tap Size):** The normalized peak amplitudes were [0.98, 0.91, 0.94, 0.94, 0.86, 0.91, 0.91, 0.84, 0.93, 0.76, 1.00]. There is no consistent downward trend. The mean amplitude of the first half of taps (0.924) was not significantly different from the second half (0.889). Therefore, **no amplitude decrement was detected**.
 - **Speed and Rhythm (Regularity):**
 - The average tapping frequency was **1.81 Hz** (mean period of 0.552 seconds).
 - The rhythm was highly regular, with a very low standard deviation of the period (0.050 s).
 - The subject did not slow down; in fact, the average tap period in the second half (0.525 s) was slightly *faster* than the first half (0.579 s).
 - The analysis identified **one interruption/hesitation**, where the first tap-to-tap period (0.6625 s) was statistically longer than the subsequent, regular taps.
-

Scoring Motivation

To assign a score, these findings are compared to the MDS-UPDRS criteria:

- **Score 0 (Normal):** "No problems."

- **Score 1 (Slight):** Any of the following: a) "the regular rhythm is broken with **one or two interruptions or hesitations**"; b) "slight slowing"; c) "the amplitude decrements near the end".
- **Score 2 (Mild):** "3 to 5 interruptions," "mild slowing," or "amplitude decrements midway."
- **Score 3 (Moderate):** ">5 interruptions," "moderate slowing," or "amplitude decrements starting after the 1st tap."
- **Score 4 (Severe):** "Cannot or can only barely perform."

The subject's performance was normal in terms of amplitude (no decrement) and speed (no slowing). The task (10 taps) was completed successfully. However, the performance was not "perfect" (Score 0) because the analysis detected a single hesitation at the very beginning of the sequence.

This finding directly matches criterion 1a: "the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement".
