The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data.

Finger Tapping Analysis Plot

The plot below visualizes the normalized distance between the thumb and index finger over the 5.82-second recording. Each detected tap (a peak in the distance) is marked with a red 'x'.

Detailed Motivation for Score

To determine the score, the data was analyzed using the provided Python script's methodology, focusing on the MDS-UPDRS criteria: speed, amplitude, and rhythm (hesitations/interruptions).

1. Speed (Slowing):

- The subject performed **11 taps** over the **5.82-second** segment.
- This results in an average tapping frequency of **1.89 taps/second (1.89 Hz)**.
- A "normal" performance (Score 0) with instructions to tap "as quickly... as possible" is typically much faster (e.g., **3 – 4 Hz**).
- This observed speed of **1.89 Hz** is clearly slow and falls into the categories of slowing. Given that it's roughly 50% of a normal rapid speed, it is best characterized as **"mild slowing."**

2. Rhythm (Hesitations and Halts):

- The time intervals between the 11 taps were calculated:
[0.66, 0.53, 0.58, 0.52, 0.60, 0.58, 0.51, 0.51, 0.50, 0.53] seconds.
- These intervals are highly consistent. The mean interval is **0.55** seconds with a very low standard deviation of **0.05** seconds.
- There are **no interruptions, hesitations, or arrests** in the movement. The rhythm is regular. This component of the performance is normal (Score 0).

3. Amplitude (Decrementing Amplitude):

- The normalized peak amplitudes for the 11 taps were:
[0.98, 0.91, 0.94, 0.94, 0.86, 0.91, 0.91, 0.84, 0.93, 0.76, 1.00] .
- There is **no evidence of decrementing amplitude**. The amplitude fluctuates but does not consistently decrease. In fact, the final tap is the largest (**1.00**). This component of the performance is normal (Score 0).

Conclusion:

The scoring criteria state that a score is assigned if *any* of the listed conditions are met.

- **Score 1 (Slight):** Requires "slight slowing," "1-2 interruptions," or "decrement near the end." The subject has no interruptions or decrement, and the slowing is more significant than "slight."
- **Score 2 (Mild):** Requires "mild slowing," "3-5 interruptions," or "decrement midway." The subject's performance perfectly matches the "**mild slowing**" criterion.
- **Score 3 (Moderate):** Requires "moderate slowing," ">5 interruptions," or "decrement after 1st tap." While the slowing could be argued as "moderate," "mild" is a fitting description for a performance that is slow but otherwise flawless in rhythm and amplitude.

The most accurate score is 2, based entirely on the presence of "mild slowing."
