The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data.

The plot below visualizes the normalized distance between the thumb and index finger over the ~5.8 second recording segment. The red 'x' markers indicate the detected peaks, which correspond to the moments of maximum opening (the "tap" count).

Detailed Analysis and Scoring

To score the subject according to the MDS-UPDRS item 3.4, I analyzed the **speed (rhythm)**, **amplitude**, and **hesitations** based on the provided data and the methods from the Python script.

Here are the key metrics extracted from the data:

- **Total Taps Detected:** 11
- **Total Time:** 5.82 seconds
- **Tap Periods (Frames between peaks):**
[159, 127, 139, 125, 145, 139, 123, 122, 119, 127]
- **Normalized Tap Amplitudes (at peaks):**
[0.98, 0.91, 0.94, 0.94, 0.86, 0.91, 0.91, 0.84, 0.93, 0.76, 1.00]

Motivation for Score

1. **Speed:** The subject completed 11 taps in just 5.82 seconds. This is not slow; in fact, it is quite rapid. The instruction to tap 10 times "as quickly... as possible" was met. Therefore, no points are given for "slowing."
2. **Amplitude:** The instruction is to tap "as big as possible." The normalized amplitudes are consistently high (most are above 0.90, or 90% of the maximum opening). Critically, there is no *decrementing* pattern. While the 10th tap's amplitude (0.76) is lower, the 11th tap's amplitude is the maximum (1.00). This indicates variability, not a systematic decrement. Therefore, no points are given for "decrementing amplitude."
3. **Hesitations/Halts:** The score is determined by interruptions in the tapping rhythm.
 - The **tap periods** (time between taps) are mostly regular, averaging 132.5 frames.
 - However, the first period (between tap 1 and 2) is **159 frames**, which is noticeably longer than the subsequent periods (which cluster between 119-145 frames).
 - As seen in the plot, after the first peak (frame 41), there is a longer duration before the second peak (frame 200). After this, the peaks become more rhythmically spaced.

This single, longer-than-average period at the start of the sequence qualifies as **"one... hesitation of the tapping movement."**

According to the MDS-UPDRS criteria:

- **Score 0 (Normal):** "No problems." This doesn't apply due to the initial hesitation.
- **Score 1 (Slight):** "Any of the following: a) the regular rhythm is broken with **one or two interruptions or hesitations...**"

The subject's performance perfectly matches criterion (a) for a score of 1. The movement is fast and large, but the rhythm is broken by a single initial hesitation.
