The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data.

The analysis script was executed on the provided data (865123482_20200713_Hands_R_12_L.mp4FT.csv). The script first generated a plot of the normalized distance between the thumb and index finger and then extracted key features to score the performance.

Analysis Plot

The following plot shows the normalized distance between the thumb and index finger over the 6.82-second recording. The detected taps (the peaks of the movement) are marked with an 'x'.

Key Performance Metrics

The script provided the following key metrics for scoring:

- **Total Duration:** 6.82 seconds
- **Total Taps Detected:** 12
- **Tapping Frequency:** 1.69 Hz (taps/second)
- **Amplitude Analysis:**
 - Mean amplitude (first half of taps): 195.05
 - Mean amplitude (second half of taps): 209.27
 - **Conclusion:** There was **no amplitude decrement**; in fact, the amplitude slightly increased by 7.29%.
- **Rhythm & Speed Analysis (Tap Periods in seconds):**
 - 0.250
 - 0.633 (Significant hesitation/slowing)
 - 0.754 (A second significant hesitation/slowing)
 - 0.625
 - 0.617
 - 0.579
 - 0.608

- 0.675
- 0.588
- 0.600
- 0.596
- **Conclusion:** The rhythm had a high standard deviation (0.118 seconds), indicating an irregular rhythm.

Detailed Motivation for Score

The MDS-UPDRS item 3.4 is scored based on **amplitude**, **speed**, and **rhythm** (hesitations/interruptions).

1. **Amplitude:** The instruction is to tap "as big as possible". The analysis shows **no amplitude decrement**. The mean amplitude actually increased from the first half to the second half. This rules out scores based on decrementing amplitude (scores 1c, 2c, and 3c).
2. **Speed (Slowing):** The instruction is to tap "as quickly... as possible". The subject starts with one very fast tap (a period of 0.250s), but then immediately slows down significantly, with subsequent taps taking 0.6s - 0.75s. This represents a clear "slowing" of the movement compared to the subject's initial capability.
3. **Rhythm (Hesitations/Interruptions):** A "Normal" (Score 0) performance should have no problems. This performance is clearly not normal. The tap periods show:
 - A fast first tap.
 - A long hesitation (0.633s) before the third tap—more than double the first period.
 - A second, even longer hesitation (0.754s) before the fourth tap.
 - After these two breaks, the rhythm becomes *slower* but more regular.

Based on the MDS-UPDRS criteria, a **Score 1 (Slight)** is given for "Any of the following: a) the regular rhythm is broken with **one or two interruptions or hesitations** of the tapping movement; b) **slight slowing**; c) the amplitude decrements near the end...".

The subject's performance perfectly matches criterion (a). The initial rhythm is broken by **two clear hesitations** (the 0.633s and 0.754s periods). The performance also shows "slowing" (criterion b). Since the criteria are "Any of the following," and the "1-2 interruptions" criterion is met precisely, a score of 1 is the most accurate.

A score of 2 ("3-5 interruptions") is not justified, as there are only two distinct breaks in the rhythm. A score of 0 ("No problems") is incorrect due to the obvious hesitations and slowing.
