The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

CSV

Here is the analysis of the finger-tapping data, based on the MDS-UPDRS Item 3.4 criteria.

Finger Tapping Performance Plot

The plot below shows the normalized distance between the thumb and index finger over the ~6.6-second (1586-frame) recording. Each peak, marked with an 'x', represents a single tap.

Detailed Analysis and Scoring Motivation

To score the performance, I analyzed the key features extracted from the data, corresponding to the UPDRS criteria (speed, amplitude, hesitations, and decrementing amplitude).

- 1. Number of Taps:** The analysis detected **11 taps** in the recorded segment.
- 2. Tapping Amplitude:** The UPDRS scale heavily penalizes *decrementing* amplitude (taps getting smaller). The sequence of un-normalized amplitudes (raw distance) at the peak of each tap was:
[193.93, 196.99, 191.25, 199.75, 202.95, 208.6, 212.87, 205.55, 216.09, 207.39, 205.14]
 - **Observation:** There is **no evidence of amplitude decrement**. In fact, the amplitude *increases* from the start (~194) to a peak value of ~216 near the end, and it is maintained throughout. This indicates the subject successfully performed the taps "as big as possible" and did not fatigue. This performance does not meet the criteria for scores 1, 2, or 3, all of which require some form of amplitude decrement.
- 3. Tapping Speed and Rhythm (Hesitations/Halts):** The criteria for impairment include slowing, interruptions, or hesitations. This is evaluated by looking at the period (number of frames) between consecutive taps.
 - **Tap Periods:** [212, 181, 150, 148, 139, 146, 162, 141, 135, 152]
 - **Observation:** The subject does *not* show "slowing" (i.e., periods getting progressively longer). If anything, the subject speeds up after a slightly slower start (period shortens from 212 to 139).
 - There are also no "interruptions," "halts," or "freezes" (e.g., an extremely long pause between taps). While the first period (212 frames) is longer than the others, this appears to be part of the subject initiating the task rather than a "break" or "hesitation" in an established rhythm. The rhythm is established quickly and maintained.

Conclusion and Score:

The subject's performance shows no signs of impairment as defined by the MDS-UPDRS scale.

- **Amplitude:** Excellent; no decrement observed.
- **Speed:** Fast and maintained; no slowing.
- **Rhythm:** No significant hesitations, interruptions, or halts.

The performance aligns perfectly with the "Normal" category.
