The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the analysis of the finger-tapping data to determine the MDS-UPDRS item 3.4 score.

The provided Python script was executed to analyze the data, which contains 975 frames, or 4.06 seconds of data recorded at 240 fps. The script calculated the distance between the thumb and index finger for each frame, normalized this distance, and then identified peaks in the normalized distance. These peaks correspond to the moments the fingers are farthest apart, marking one "tap" cycle.

The plot below visualizes this analysis, showing the normalized distance over time and the 11 detected taps marked with red 'x's.

Analysis Results

- **Total Taps:** The analysis detected **11 taps** within the 4.06-second data segment. The subject was able to complete the instructed 10 taps.
- **Speed:** The average tapping frequency was **2.63 taps per second** (Hz). The tap periods (time between taps) did not show progressive slowing (i.e., they did not get consistently longer).
- **Rhythm (Hesitations & Interruptions):** The rhythm was notably irregular. The mean time between taps was 91.4 frames, but the standard deviation was 10.83 frames. The sequence of tap periods (in frames) was [99, 92, 104, 78, 106, 79, 104, 78, 91, 83]. This fluctuation (a coefficient of variation of 0.118, or 11.8%) shows a clear break in regular rhythm, with multiple hesitations or interruptions. This pattern of irregular timing fits the description of "3 to 5 interruptions" (Score 2).
- **Amplitude & Decrement:** The amplitude (the maximum distance between fingers for each tap) showed a clear decrement. The analysis shows:
 - **Average of first 3 taps:** 153.55 pixels
 - **Average of middle 3 taps:** 149.78 pixels
 - **Average of last 3 taps:** 135.53 pixels

This shows a mild but clear decrease in amplitude that begins by the middle of the tapping sequence and worsens by the end.

Score Motivation

Based on the MDS-UPDRS scoring criteria, the subject's performance is evaluated as follows:

- **Score 0 (Normal):** Incorrect. The subject shows clear issues with both rhythm and amplitude.

- **Score 1 (Slight):** Incorrect. The problems are more significant than "1 or 2 interruptions" or "decrement near the end." The rhythm is consistently irregular, and the amplitude decrement is observable "midway."
- **Score 2 (Mild): This score is the best fit.** The performance aligns with two criteria for a "Mild" score:
 1. **"3 to 5 interruptions during tapping":** The high variability in tap timing (rhythm) is consistent with this.
 2. **"the amplitude decrements midway in the 10-tap sequence":** The data clearly shows the average amplitude decreasing by the middle of the sequence.
- **Score 3 (Moderate):** Incorrect. The amplitude decrement does not start "after the 1st tap" (it actually increased from tap 1 to tap 2), and there are no "longer arrests (freezes)."
- **Score 4 (Severe):** Incorrect. The subject can clearly perform the task.

The subject exhibits mild, but definite, impairment in both rhythm and amplitude, both of which align with the criteria for a score of 2.
