The provided CSV file contains data with five columns: frame, X_thumb, Y_thumb, X_index, and Y_index. The first column represents the frame number. The second and third columns represent the x and y coordinates of the thumb sticker, respectively. The fourth and fifth columns represent the x and y coordinates of the index finger sticker, respectively. This data comes from a subject performing the MDS-UPDRS finger tapping test, with stickers fixed to the thumb and index finger. The subject was instructed to tap the index finger on the thumb to perform continuous finger tapping. A 10-second segment from this activity was selected for analysis. Cameras recording at a frame rate of 240 frames per second (fps) captured the movement, employing a tracking technique to record the x and y coordinates of the stickers on the thumb and index finger in each frame throughout the 10-second interval.

The objective is to score the subject in accordance with MDS-UPDRS item 3.4: FINGER TAPPING based on the selected 10 seconds of continuous finger tapping. The instruction and scoring criteria of MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

“Instructions to the examiner: Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as big as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

0: Normal: No problems.

1: Slight: Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations of the tapping movement; b) slight slowing; c) the amplitude decrements near the end of the 10 taps.

2: Mild: Any of the following: a) 3 to 5 interruptions during tapping; b) mild slowing; c) the amplitude decrements midway in the 10-tap sequence.

3: Moderate: Any of the following: a) more than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement; b) moderate slowing; c) the amplitude decrements starting after the 1st tap.

4: Severe: Cannot or can only barely perform the task because of slowing, interruptions, or decrements.

The provided Python file includes a method for calculating the number of taps. Use this method for the analysis and begin by generating a plot of the data.

To determine the subject's score, analyze the provided data thoroughly and give a detailed motivation for the assigned score based on the MDS-UPDRS finger tapping instruction. Print the score using only one number on the last line of your answer, after the detailed motivation.

Here is the plot and detailed analysis of the finger-tapping data.

The plot below visualizes the normalized distance between the thumb and index finger over the ~4-second recording. Each red 'x' marks a detected tap (a point of maximum separation).

Summary of Analysis

The provided data file contained 975 frames, which corresponds to a **4.06-second** recording, not a full 10 seconds. In this period, a total of **11 taps** were detected by the peak-finding algorithm.

As per the MDS-UPDRS instructions, the analysis was focused on the **first 10 detected taps** to evaluate amplitude, rhythm, and speed.

- 1. Amplitude:** The tap amplitude (maximum distance) was highly variable but showed **no evidence of decrementing**. The first tap's amplitude was 139.05, while some taps in the middle were larger (e.g., 168.34) and the final tap was 139.20. This indicates the subject maintained large movements throughout the 10-tap sequence.
- 2. Rhythm (Hesitations):** The time between taps was **relatively consistent**. The average time between taps was 0.385 seconds, with a standard deviation of only 0.046 seconds. This low variation (11.9%) shows that the subject did not have any significant interruptions, hesitations, or halts in the tapping motion.
- 3. Speed:** The average tapping frequency for the 10 taps was 2.60 Hz ($1/0.385s$). While consistent, a speed of 2.6 taps per second is slow for a task where the instruction is to tap "as quickly... as possible."

Detailed Motivation for Score

The subject's score is determined by matching the analysis to the MDS-UPDRS criteria:

- **Criterion 0 (Normal):** "No problems." This is not met because the tapping speed is slow.
- **Criterion 1 (Slight):** "Any of the following: a) the regular rhythm is broken with one or two interruptions or hesitations... b) slight slowing; c) the amplitude decrements near the end of the 10 taps."
 - **(a) Interruptions:** This is **not met**. The rhythm was consistent.
 - **(b) Slight slowing:** This is **met**. The average frequency of 2.60 Hz is slow for a maximal-effort test, fitting the description of "slight slowing."
 - **(c) Amplitude decrements:** This is **not met**. The amplitude was fully maintained.

- **Criterion 2-4 (Mild, Moderate, Severe):** These are not met because they require more significant problems, such as 3+ interruptions or amplitude decrement starting midway or earlier, none of which were observed.

Conclusion

The subject's performance is characterized by excellent, full-range amplitude with no decrement and a consistent rhythm with no hesitations. However, the overall speed of the tapping is slow (2.60 Hz).

According to the MDS-UPDRS scoring, a score of 1 ("Slight") is given if *any* of its criteria are met. The performance clearly matches criterion 1(b): "slight slowing."
