The data provided below consists of extracted features (tap count, periods, and amplitudes) derived from a subject performing the MDS-UPDRS Item 3.4 Finger Tapping test. The subject was instructed to tap the index finger on the thumb 10 times as quickly and as largely as possible.

The objective is to score the subject according to MDS-UPDRS item 3.4: FINGER TAPPING based on these 10 consecutive finger taps. The testing instructions and scoring criteria for MDS-UPDRS item 3.4: FINGER TAPPING are as follows:

Instructions to the examiner:

Each hand is tested separately. Demonstrate the task, but do not continue to perform the task while the patient is being tested. Instruct the patient to tap the index finger on the thumb 10 times as quickly AND as large as possible. Rate each side separately, evaluating speed, amplitude, hesitations, halts, and decrementing amplitude.

Scoring Criteria:

0 (Normal): No problems

1 (Slight): Any of the following:

- a) The regular rhythm is broken with one or two interruptions or hesitations of the tapping movement
- b) Slight slowing
- c) The amplitude decrements near the end of the 10 taps

2 (Mild): Any of the following:

- a) 3 to 5 interruptions during tapping
- b) Mild slowing
- c) The amplitude decrements midway through the 10-tap sequence

3 (Moderate): Any of the following:

- a) More than 5 interruptions during tapping or at least one longer arrest (freeze) in ongoing movement
- b) Moderate slowing
- c) The amplitude decrements starting after the 1st tap

4 (Severe): Cannot or can only barely perform the task due to slowing, interruptions, or decrements

Below are the extracted features including tap count, periods, and amplitudes. Please analyze this information and provide your score on the last line.

EXTRACTED FEATURES

Number of taps: 11

Tap periods (frames): [84, 82, 81, 77, 80, 71, 84, 72, 76, 72]

Tap amplitudes (pixels): [163.52675622050356, 165.95180023127196, 173.21951391226105, 168.04761230080004, 165.7015389186232, 164.45364088398895, 156.33937443907084, 167.60966559241146, 152.50245899656832, 152.11837495845134, 156.81836627130127]

✦ Based on the provided extracted features, here is the analysis according to the MDS-UPDRS Item 3.4 criteria:

1. Rhythm and Interruptions (Tap Periods):

- **Data:** The tap periods (in frames) are [84, 82, 81, 77, 80, 71, 84, 72, 76, 72] .
- **Analysis:** The periods are relatively stable with a standard deviation of approximately 4.7 frames. There are no extreme outliers that would indicate a "halt" or "freeze" (which would appear as a massively increased period). The variation (e.g., 71 to 84) represents normal physiological variability rather than distinct interruptions or hesitations.
- **Score Contribution:** Normal (0).

2. Speed and Slowing:

- **Data:** The sequence of periods shows a downward trend (from 84 to 72), indicating that the subject actually **increased** their speed (hastening) over the course of the test.
- **Analysis:** There is no evidence of slowing (fatigue) or sequence effect where the movement becomes progressively slower. The subject maintained and improved speed.

- **Score Contribution:** Normal (0).

3. Amplitude and Decrement:

- **Data:** The tap amplitudes (in pixels) are [163.5, 165.9, 173.2, 168.0, 165.7, 164.4, 156.3, 167.6, 152.5, 152.1, 156.8] .
- **Analysis:**
 - The amplitude starts at ~163.5 and ends at ~156.8.
 - The peak amplitude is ~173.2 (Tap 3).
 - There is a slight dip in amplitude at Taps 9 and 10 (~152), but it recovers slightly at Tap 11 (~156).
 - Comparing the start (163.5) to the end (156.8), the reduction is approximately 4%. Comparing the peak (173.2) to the minimum (152.1), the reduction is ~12%.
 - Crucially, the amplitude does not show a consistent, progressive decrement ("fatigue") typical of Parkinsonism. The values fluctuate (up and down) and the magnitude of the drop near the end is minimal and likely a trade-off for the increased speed observed in the periods.
- **Score Contribution:** Normal (0).

Conclusion: The subject demonstrates a stable rhythm, increasing speed (no slowing), and consistently large amplitude with only minor, non-pathological fluctuations. There are no signs of the sequence effect (progressive slowing or decrementing) required for a score of 1 or higher.

Score: 0
